Obtener el valor de

$$\mathbf{A} = \frac{(-5)(3) - (4)(3)}{(-2)(-3) + 3}$$

Recordar

Leyes de signos

$$(-3)(-2) = +6$$

$$(+3)(-2) = -6$$

$$(-3)(+2) = -6$$

$$(+3)(+2) = +6$$

$$A = \frac{-15 - 12}{+6 + 3}$$

$$\mathbf{A} = \frac{-27}{9}$$

$$\therefore A = -3$$

Calcular el valor de N - M

M =
$$(-3) + ($$

$$N = -2 - 2 - 2 - 2 \dots - 2$$

Recordar

$$(-4) + (-4) + (-4) = -4 - 4 - 4 = -12$$

$$3(-4) = -12$$

Resolución3

Nos piden N - M

$$N - M = -20 - (-120)$$

$$N - M = -20 + 120$$

$$\therefore N-M=100$$

Halle el resultado de E^3

$$E = \frac{2}{7} + \frac{3}{5} + \frac{9}{7} + \frac{1}{5} - \frac{4}{7} + \frac{1}{5}$$

Recordar

Fracciones Homogéneas

$$\frac{a}{b} + \frac{c}{b} = \frac{a+c}{b}$$

$$E = \frac{2}{7} + \left(\frac{3}{5}\right) + \left(\frac{9}{7}\right) + \left(\frac{1}{5}\right) - \left(\frac{4}{7}\right) + \left(\frac{1}{5}\right)$$

$$E = \frac{2+9-4}{7} + \frac{3+1+1}{5}$$

$$E=\frac{7}{7}+\frac{5}{5}$$

$$E=1+1 \longrightarrow E=2$$

$$\therefore E^3 = 2^3 = 8$$

01

Problema 4

Calcular el valor de

$$J = \frac{2}{5} + \frac{2}{3} - \frac{1}{4}$$

Recordar

$$\frac{3}{2} - \frac{2}{5} + \frac{1}{10}$$

$$mcm(2; 5; 10) = 10$$

$$\frac{15-4+1}{10}=\frac{12}{10}=\frac{6}{5}$$

$$J = \frac{2}{5} + \frac{2}{3} - \frac{1}{4}$$

$$J = \frac{24 + 40 - 15}{60}$$

$$\therefore J = \frac{49}{60}$$

01

Problema 5

Calcular el valor de

$$\mathbf{M} = \frac{\frac{2}{3} + \frac{1}{5}}{2 + \frac{1}{5}}$$

Recordar

$$\frac{\frac{3}{4}}{\frac{5}{2}} = \frac{3 \times 2}{4 \times 5} = \frac{3}{10}$$

$$M = \frac{2 + \frac{1}{5}}{2 + \frac{1}{5}}$$

$$M = \frac{\frac{2.5 + 3.1}{15}}{\frac{2.5 + 1}{5}} = \left(\frac{\frac{13}{15}}{\frac{11}{5}}\right)$$

$$M = \frac{13 \times 5}{15 \times 11} = \frac{13}{3.11}$$

$$\therefore M = \frac{13}{33}$$

Calcule el valor de 2x

$$\frac{x+1}{5}=\frac{2x-5}{8}$$

Recordar

Regla del aspa

$$\frac{x+2}{3}$$
 $=$ $\frac{x+1}{2}$

$$2(x+2)=3(x+1)$$

$$2x + 4 = 3x + 3$$

$$1 = x$$

Resolución:

$$\frac{x+1}{5} = \frac{2x-5}{8}$$

Multiplicando en aspa

$$8x + 8 = 10x - 25$$

$$33 = 2x$$

$$\therefore 2x = 33$$

◎1

Problema 7

Calcule el valor de 10x

$$\frac{x}{3} + 2 = \frac{3x}{4} - 1$$

Recordar

Fracción

Mixta

$$\frac{x}{2} + \frac{1}{2} = \frac{x+2}{2}$$

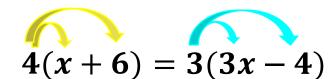

Resolución:

$$\frac{x}{3}+2=\frac{3x}{4}-1$$

Aplicamos fracción mixta

$$\frac{x+6}{3} = \frac{3x-4}{4}$$

$$4x + 24 = 9x - 12$$

$$36 = 5x$$

$$\therefore 10x = 72$$

Calcular el valor de "m" en:

$$\frac{m}{5} + \frac{m}{3} + \frac{m}{2} + \frac{m}{6} = 144$$

Recordar

$$\frac{3}{2} - \frac{2}{5} + \frac{1}{10}$$

$$mcm(2; 5; 10) = 10$$

$$\frac{15-4+1}{10} = \frac{12}{10} = \frac{6}{5}$$

Resolución:

$$\frac{m}{5} + \frac{m}{3} + \frac{m}{2} + \frac{m}{6} = 144$$

m. c. m (5; 3; 2; 6) = 30

Luego

$$\frac{12m + 20m + 30m + 10m}{30} = 144$$

$$\frac{72m}{30}=144$$

$$72m = 144 \times 30$$

$$m = 2 \times 30$$

$$m = 60$$

La edad de Angie esta dado por el valor de x en:

$$2(x+5) + 3(x+8) = 4x + 66$$

Mañana conocerá a su primo
Carlos quien es 5 años mayor
que ella, calcule la suma de
ambas edades.

$$4(x+6) = 4x+24$$

Resolución:

$$2(x+5)+3(x+8) = 4x + 66$$

$$2x + 10 + 3x + 24 = 4x + 66$$
$$5x + 34 = 4x + 66$$

$$5x-4x = 66 - 34$$

Luego

$$x = 32$$

Angie tiene 32 años

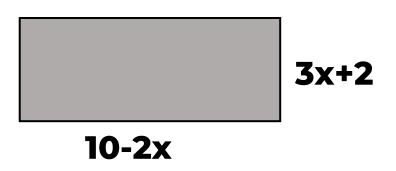

Carlos tiene 37 años

 \therefore suma de edades = 69

Calcule el perímetro del siguiente terreno rectangular

perimetro = 2(base + altura)

$$perimetro = 2[(10-2x) + (3x+2)]$$

$$perimetro = 2[12+x]$$

$$perimetro = 24 + 2x$$

perimetro = 2x + 24
